Origin-independent analysis flowchart. (A) BLAST alignments were implemented between the high-quality sequencing reads from the data sets identified from four sequencing platforms and the assembled genomes in the coronavirus databases—the NCBI Betacoronavirus database and our customized database. Left: the sample numbers from the 32 raw RNA-seq and DNA-seq data sets collected from SRA; and ...

The genome of eukaryote species is embedded into the nuclei of their cells. This is due to the presence of nucleosomes, which are histone octamers where 150 bp of DNA are wrapped in about 1.7 turns, separated by stretches of DNA referred as linker sequences. Starting from this low-level organization, the nucleosomes arrange themselves through successively higher-order structures to finally ...
