GPRS stands for General packet radio services. It is used to give higher data speed over GSM. GPRS is the just extension to the older GSM technology to gain faster speed. while EDGE called an Enhanced data rate for GSM Evolution. It also termed as Enhanced GPRS. EDGE technology that must use the same equipment as GSM with only a few minor modifications to provide faster speeds and is often regarded as a stepping stone towards 3G thus it is called 2.5G.

Difference between GPRS and EDGE - ECSTUFFAU
The combination of GPRS and EDGE is referred to as enhanced GPRS (EGPRS). EGPRS comprises the 43 series of specifications managed by the 3rd generation partnership project (3GPP) [[1]] EDGE and GPRS technologies are commonly called 2.5G because they offer capabilities that are above the present day 2G digital cellular systems (greater than 14 kbps) but do not achieve the performance of 3G systems (less than 2 Mbps).

EDGE is often called Enhanced GPRS (EGPRS) and concurrent work by ETSI and UWCC ensures that the framework developed works fine with both GSM and TDMA/136 systems. The roadmap was laid in two phases, the first emphasized on developing EGPRS and ECSD and the second focused on improving multimedia and real time support.
