Normal inspiration generates negative intrapleural pressure, which creates a pressure gradient between the atmosphere and the alveoli, resulting in air inflow. In mechanical ventilation, the pressure gradient results from increased (positive) pressure of the air source. Peak airway pressure is measured at the airway opening (Pao) and is routinely displayed by mechanical ventilators.

Overview of Mechanical Ventilation - Critical Care ...

Mechanical ventilation can be provided via non-invasive or invasive means and involves the delivery of positive pressure breaths. Gas flow is delivered via a constant or decelerating pattern and the volume is dependent on inspiratory time, gas flow and pressure applied at the airway. Pressure, flow, time and volume are all interrelated.
