After 16-year postorthodontic retention period, an acceptable occlusion was maintained without recurrence of any TMD symptoms, indicating a long-term stability of occlusion and the TMJ components. Our results suggest the possibility of compromised treatment in patients with TMD to achieve long-term stability in occlusion and TMJ function.

reported as moderate regardless of the treatment modality, surgical or non-surgical (Lopez-Gavito et al., 1985). It was suggested that stability might be complicated because of the influence of the musculature, thus control of tongue habits and muscular training is a major factor in achieving stability after open bite correction.
