The following diagram illustrates an enhanced version of a multi-spark CDI circuit. Fundamentally it can bifurcated into two discrete stages. Both the stages incorporates the IC IR2155 mosfet driver with built in 50% duty cycle oscillator. The upper stage consisting of Q1, Q2 are configured for generating 300V DC from the available 12V DC input ...

Max Spark: Why You Need A Multi-Spark Ignition

Multi sparking is the firing of the spark plug multiple times in rapid close succession to create an 'overall' spark of longer duration and energy.

triggering is done with 9V battery/power supply, a faint single spark could be heard at the spark plug but not visible.

3) One point which might be or not important. The CDI unit is having 400V capacitor whereas, the boost circuit is producing 610V.

I'm still looking for the filter choke that I removed from the +12V DC circuit of my CDI. This might help reduce the "0.5V noise". Here's the picture of 0.5V noise on dc supply at high rpm. There were 4 going low pulse created by multiple firing of CDI at high rpm. Initially there were 6 trigger pulse at 800 rpm.
