The following is a simplified version of the last 2007 WHO classification of the tumours of the central nervous system.

Currently, as of 2016, clinicians are using revised WHO grade 4th edition which incorporates recent advance in molecular pathology. The 4th revised edition, as the name implies, will soon

schwannomatosis. In  
these disorders,  
tumors develop on or  
near the nerves  
throughout the body.  
These tumors, which  
are frequently multiple,  
can lead to a variety of  
symptoms and signs  
depending on their  
location. These tumors  
are usually  
noncancerous.

The spinal cord and special nerves in the head called cranial nerves carry and receive messages between the brain and the rest of the body.

There are two types of brain tumors: Primary — a tumor that starts in the brain. Primary brain tumors can be benign (noncancerous) or malignant.

occur much more often  
in children than in  
adults. They are part of  
a class of tumors called  
embryonal tumors that  
can also start in other  
parts of the central  
nervous system. For  
more information on  
these tumors, see

Central nervous system (CNS) germ cell tumors are a group of brain tumors that include germinomas and non-germinomatous germ cell tumors (NGGCT). They are thought to arise during early development of the fetus when germ cells, the cells that later become sperm and egg cells, migrate to the brain where they begin to form tumors.
