What Is Alzheimers Evidence Based

Scientists believe that for most people, Alzheimer's disease is caused by a combination of genetic, lifestyle and environmental factors that affect the brain over time. Less than 1 percent of the time, Alzheimer's is caused by specific genetic changes that virtually guarantee a person will develop the disease.

Alzheimer's disease - Symptoms and causes - Mayo Clinic

Alzheimer's is a progressive disease, where dementia symptoms gradually worsen over a number of years. In its early stages, memory loss is mild, but with late-stage Alzheimer's, individuals lose the ability to carry on a conversation and respond to their environment. Alzheimer's is the sixth leading cause of death in the United States.

What is Alzheimer's Disease? Symptoms & Causes | alz.org

Alzheimer's disease is an irreversible, progressive brain disorder that slowly destroys memory and thinking skills, and, eventually, the ability to carry out the simplest tasks. In most people with Alzheimer's, symptoms first appear in their mid-60s.
